

Market-Test Campaign Report – “Vintado” (Vinted-style app for Argentina)

Objective: Gauge initial interest – no sales targets • Budget: €1 / day • Data as of 23 May 2025

1 | Snapshot of the Test

Metric	Result	Relevance to market test
Reach	4 382 people	Size of cold audience that saw the value proposition
Impressions	5 260	Shows frequency (1.2×) – message wasn’t repeated excessively
Link clicks	232	Users curious enough to visit the landing page
Click-through rate	4.4 %	>2× typical benchmark → message resonates
Cost per click	€0.01	Very inexpensive traffic for further testing
Confirmed waiting-list sign-ups	3	Concrete signal of “I want early access”
Sign-up rate (LP conversion)	1.3 % of clickers (0.07 % of reach)	Primary indicator of real intent
Cost per interested lead	≈ €0.77	Low—good for early-stage experiments

Spend is inferred at ≈ €2.32 (232 × €0.01). If Ads Manager shows €2.09, CPL shifts to €0.70 – conclusions stay the same.

2 | What the Numbers Mean for Market Interest

Signal	Interpretation
High CTR & ultra-low CPC	The ad headline/creative clearly grabbed attention; curiosity about a "Vinted-like" concept in Argentina is real.
3 sign-ups from 232 visitors	Roughly 1 in 75 visitors (or 1 in 1 460 people reached) felt motivated enough to join a waiting list with virtually zero brand credibility. That's <i>small</i> but promising for a €2 test .
Cost per interested user < €1	You can affordably acquire early adopters; scaling the test to 100–200 leads would cost < €150 at the current efficiency.
Sample size still tiny	Three sign-ups is not statistically meaningful; you need ≥50–100 leads to judge true demand, segment interest, and collect qualitative feedback.

3 | Next Validation Steps (No-Code / Low-Cost)

Step	Purpose	How
1. Scale budget to €3–€5/day for one week	Get ~1 000 clicks → 15–30 sign-ups (extrapolated)	Keep current winning creative; pause under-performers.
2. Add a 2-question typeform after sign-up	Qualitative insight: <i>"What would you buy/sell first?"</i> & <i>"Biggest worry?"</i>	Helps shape MVP features and buyer/seller messaging.
3. Test a "Lead Ad" form inside Meta	Removes landing-page friction; measures raw interest	Compare cost per lead vs. link-click funnel.
4. Iterate creatives (carousel of thrifted items vs. mock-ups of the app)	See which positioning resonates: savings, eco-friendly, trendy brands	Rotating creatives sustains CTR and refines message.
5. Retarget clickers who didn't sign up	Check if the concept needs more persuasion time	Simple "Spots are limited – join the beta" reminder.
6. Build a wait-list email drip	Keep early adopters warm & ask for testimonials later	Even a basic MailerLite/Brevo sequence is enough now.
7. Set a "success threshold"	Decide go / pivot after data	e.g., "If we reach 300 sign-ups at <€2 CPL by day 30 → move to MVP build."

4 | Key Takeaways for Stakeholders

1. **Proof of curiosity:** The ad copy about a Vinted-like marketplace clearly cuts through—4 %+ CTR confirms relevance.
 2. **Initial intent exists but must be quantified:** Three early adopters from ~€2 spend is encouraging but statistically thin.
 3. **Validation still cheap:** At sub-€1 CPL, you can collect hundreds of leads for a few hundred euros—well within lean-startup budgets.
 4. **Focus now shifts from traffic to insight:** Use further spend to learn *who* is interested (fashionistas, budget-seekers, eco-conscious users) and *why*, not just to grow vanity lead counts.
-

5 | Decision Framework

Question	If Yes	If No
Can we hit 200+ sign-ups at ≤ €1 CPL by the end of the next sprint?	Proceed to prototype UX & seller onboarding tests.	Pivot message (niche category, localisation, value prop) and re-test.

Bottom line:

A €1/day smoke test produced strong click interest and the first 3 waiting-list members at rock-bottom cost. Double down on data collection over the next 7–14 days, gather qualitative insights, and establish a clear numeric milestone to green-light or tweak the project.
